amplification primers recombination or RAD51 polynucleotides, useful for e.g. controlling tion or transformation efficiency in plants, or as p tion primers for detecting, quantifying or isolating probes gene or

Claim 1; Page 68-69; 76pp; English.

The present sequence is a maize RAD51 orthologue #1 cDNA. RAD51 is one CC of the genes of the RAD52 epistasis group that is involved in double strand breaks (DSBs) repair by homologous recombination. Control of CC homologous recombination by modulating RAD51 is used for improving CC transformation and gene targetting in transgenic plants. The RAD51 cnucleotide may be used as probes or amplification primers for detecting, CC quantifying or isolating gene transcripts, in detecting deficiencies in CC the mRNA level during screening for desired transgenic plants, for CC thanges in enzyme activity, for detecting upregulation of expression or CC cranges in enzyme activity, for detecting any number of allelic variants, CC orthologues or paralogues of the gene, or for site directed mutagenesis in enwaryotic cells. It may also be used for recombinant expression of CC its encoded polypeptide, or for use as immunogen in preparing and/or CC screening of antibodies, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The RAD51 proteins may be used in assays to agonise or antagonise the enzyme function, or as CC immunogens or antigens to obtain antibodies.

It may also be used for recombinant expression of its encoded polypeptide, or for use as immunogen in preparing and/or screening of antibodies, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The RAD51 proteins may be used in assays to agonise or antisponise the enzyme function, or as immunogens or antigens to obtain antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a maize RAD51 orthologue #3 cDNA. RAD51 is one of the genes of the RAD52 epistasis group that is involved in double strand breaks (DSBs) repair by homologous recombination. Control of homologous recombination by modulating RAD51 is used for improving transformation and gene targetting in transformation.
                                                                                                                                                                                                                                                                                                                                                       Sequence 1333
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New maize RAD51 polynucleotides, useful for e.g. controlling recombination or transformation efficiency in plants, or as pamplification primers for detecting, quantifying or isolating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               homologous

                                                                                                                                                 The present sequence is a maize RAD51 orthologue #2 cDNA. RAD51 is one co of the genes of the RAD52 epistasis group that is involved in double strand breaks (DSBs) repair by homologous recombination. Control of homologous recombination by modulating RAD51 is used for improving transformation and gene targetting in transgenic plants. The RAD51 controled may be used as probes or amplification primers for detecting, quantifying or isolating gene transcripts, in detecting deficiencies in the mRNA level during screening for desired transgenic plants, for controlled plants, for detecting and number of allelic variants, controlled plants, for detecting and in encombinant expression of controlled plants, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The RAD51 proteins may be considered and plants to appoints or antiscense suppression, or as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뫄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                         adenocarcinoma and leukaemia; immune disorders such as AIDS, Addison's disease, diabetes mellitus, rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, and myasthenia gravis; infections and trauma. Antagonists of the HTRM polypeptides are useful for treating or preventing disorders associated with increased expression or activity of HTRMs. HTRM polypeptides, their immunogenic fragments or oligopeptides are useful for screening libraries of compounds in drug screening techniques. Polynucleotides encoding HTRM are useful for blocking the transcription of mRNA and regulating gene function by modulating the activity of HTRM vertors expressing under the force of the production of mRNA and regulating gene function by modulating the activity of HTRM vertors expressing under the force of the production of mRNA and regulating gene function by modulating the activity of HTRM vertors expressing under the production of mRNA and regulating the activity of HTRM are useful for blocking the activity of the activity

Nucleotide sequences encoding HTRM may be useful to generate hybridization probes useful in mapping the naturally occurring gen sequence and to detect differences in gene sequences among normal, carrier and affected individuals. Using diagnostic assays, cancer detected prior to the appearance of clinical symptoms and thereby progression of cancer can be prevented by aggressive treatment or

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1146
                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide D1875

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     monitoring gene expression
                                                                                                                                                                                                                                                                                                        430

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1146
                     The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-JUL-2000; 2000WO-US20476
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-FEB-2001

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 936 BP; 6 A; 138 C; 8 G; 8 T; 776 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                 489

                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on

/note="Organ: Floral-induced meristems; vector:
/note="Organ: Floral-induced meristems; vector:
pBluescript II from Lambda Zap II; Site_1: XhOI; Site_2:
ECORI; mature plants were placed in a growth chamber for
15 days with 16 hr darkness and 8 hr light (flowering is
induced by short-day conditions); 16 days after being
returned to the greenhouse under natural long days during
late April/early May, meristems were harvested The
library was made from poly-A RNA in the cloning vector
lambda Zap II. Clones to be sequenced were prepared by
mass excission."
